Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs (cloneIDS 1057416-1061255, and 1144584-1145351).

/tissue_type="pooled_germ cell tumors"
/lab_host="Dblob"
/lab forward and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneids 1257096-128631, 146964-1470983, and 145592-1476743). Subtraction by Bento Soares and M. Fatima Bonaldo. "

Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT713 vector. This library is the normalized version of NCI_CGAP_BT1.1. Library was constructed by Bento Soares and M. Fatina Bonaldo.

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS2 gene ORF T00745 (which encodes R81702). The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc.

This sequence encodes the MTS polypeptide encoding connact may septypeptide MTS (RBOQ48). WITS polypeptide encoding connact and mutents of these are useful for the diagnosis or prognosis of diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also screening for potential cancer therapeutics
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

mutation(s) and their treatment
Disclosure; Fig 11; 72pp; English.
This cDNA sequence encodes a human multiple tumour suppression protein,
MTS2. The MTS gene locus is also referred to as the familial melanoma
(MLM) gene locus, located on human chromosome 9p21. Germ line mutations
(MLM) genes can be used in the diagnosis of predisposition to cancers,
e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma,
Hoddykin's lymphoma, CLL, and cancers of the pancreas, breast, thyroid,
ovary, uterus, testis, kidney, stomach and rectum.

                                                                                                                                                                                                                                                                                                                               Disclosure; Fig 11; 73pp; English.

This is the nucleotide sequence of the multiple tumour suppressor

This is the nucleotide sequence of the multiple tumour suppressor

(MTSIEIS) gene, used in the method of the invention. The MTS gene

(Is useful in the diagnosis and prognosis of human cancer, e.g. by

standard nucleic hybridisation techniques, of patient samples. The

mutated sequences are those that are present in somatic mutations

(C) of the gene in cancers. The vectors can be used for gene therapy

strategies to replace function of mutated protein in patients. These

can also be used to construct protein mimtatics, also for therapeutic

strategies. In addition the expression constructs can also be used

for recombinant production of MTS. Recombinant MTS can also be used

for recombinant production of MTS. Recombinant MTS can be used to

screen for drugs to be used for cancer therapy, and the protein

strategies are also be used to restore MTS function in a cell.

Worletc acids based on multiple tumour suppressor, MTS, sequences useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS
04-DEC-1998 (first entry)
Coding sequence 2 of the multiple tumour suppressor MTSIEIS.
Multiple tumour suppressor; MTSIEIS; human; cancer; hybridisation; somatic mutation; gene therapy; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GCGCTAGGCGCTTTTTCCCAGAAGCAATCCAGGCGCGCCCGCTGGTTCTTGAGCGCCCAGG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               68
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        protein.
                                                                                                           The present sequence encodes a human multiple tumour suppressor 2 (MTS2) protein. The sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemla,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                9 GAGGACTCCGCGACGCGTCCGCACCCTGCGGCCAGACGGGCTTTGAGCTCGGCTGCGTCC

Detecting polymorphism associated with cancer pre:disposition - a Detecting polymorphism associated with cancer pre:disposition - therapy and drug screening therapy and drug screening Example 6; Page 96; 148pp; English.
                                                                                                                                                                                                                                 Example 6; Page 96: 148pp; English.

An individual can be diagnosed as having a predisposition to by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to (T00741) of the MTS2 gene. The above assay can also be used idagnosis and prognosis of melanoma, lymphoma, leukaemia and panoreas, breast and thyroid cancers, etc. . 355 G; 260 T; Sequence 1244 BP; 279 A; 343 C; 355 G; 260 T;

Human MTS2 genomic DNA including exon 2.
MTS1: multiple tumour suppressor; diagnosis; cancer; germ-line mutation; familial melanoma locus; MLM; predisposition; ds.
                                                                                                                            Example 6; Page 96; 156pp; English.

The cDNA sequences encoding several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced. This sequence includes hotron 2, exon 2 and part of intron 1 of the MTS polypeptide, MTSL MTS polypeptide-encoding cDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS CDNAs can be used for diagnosing predisposition to melanoma, leukaemia, astrocytoma, glioblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL and cancers of the pancreas, thyrold, ovary, uteras, testis, kidney, stomach and rectum. The wild-type gene is useful for gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg an altered MTS gene are useful for screening for potential cancer therapeutics.

Useful for the diagnosis of cancers related to MTSIE1-beta mutation (s) and their treatment mutation (s) and their treatment bisclosure; Fig 7: 72pp; English.

This sequence encodes the human multiple tumour suppression protein, MTSI, exon 2. The MTS gene locus is also referred to as the familial melanoma (MLM) genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemla, astrocytoma, gliboblastoma, lymphoma, glioma, Hodgkin's lymphoma, CLL, and cancers of the pancreas, breast, thyrold, ovary, uterus, testis, kidney, stomach and rectum. Disclosure: Fig 7A-7B; 73pp; English.

This is the nucleotide sequence of the multiple tumour suppressor 2

This is the nucleotide sequence of the invention. The MTS gene
is useful in the diagnosis and prognosis of human cancer, e.g. by

standard nucleic hybridisation techniques, of patient samples. The
nutated sequences are those that are present in somatic mutations
of the gene in cancers. The vectors can be used for gene therapy
strategies to replace function of mutated protein in patients. These
can also be used to construct protein minetics, also for therapeutic
strategies. In addition the expression constructs can also be used
to recombinant production of MTS. Recombinant MTS can be used to
correct for recombinant production of MTS. Recombinant MTS can be used to
screen for drugs to be used for cancer therapy, and the protein
ttself may also be used to restore MTS function in a cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   01-MAR-1996 (first entry)
Cell-cycle requlatory protein p15 cDNA.
Cell-cycle requlatory protein p15; cyclin-dependent kinase inhibitor;
CCR; gene therapy; transgenic animal; cancer; cell proliferation;
ss; ds.
                                                                                                                                                                                       Example 6; Fig 7A-B; 80pp; English.

The present sequence represents part of intron 1, exon 2 and intron 2 for a human multiple tumour suppressor 2 (MTS2) gene. The MTS1 sequence is homologous to the corresponding murine gene. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas,

(CR) Coding for the mouse cell-cycle regulatory (CCR) protein p15 (R85118) was isolated from an embryonal carcinomal library using a probe based on a mouse CCR p13.5 cDNA (T02965). The isolated cDNA can be used: to detect mutations in CCR genes that lead to cell proliferation; to breed transgenic animals to study cellular disorders involving CCR allele mutation/misexpression; and to correct CCR-deficient cells
                                                                                                                                                                                                                                  Length 580;

Fusion and chimaeric proteins including cyclin-dependent kinase
binding motif - used for regulation of cell proliferation and
liferentiation, for treatment of, e.g. vascular injury, cancers,
fibrosis and neurodegeneration

S claim 60: Page 85: 88pp; English.

Claim 60: Page 85: 88pp; English.

The invention relates to novel inhibitors of cyclin-dependent kinases
CCDKs), particularly CDKCyclin complexes. It provides a recombinant
transfection system (A) that comprises: (i) first gene construct
comprising a sequence encoding an inhibitory polypeptide containing at
lanked to a transcription regulator functional in eukaryotic cells; (ii)
second gene construct comprising a sequence encoding a polypeptide that
construct comprising a sequence encoding a polypeptide that
promotes endothelialisation, and (iii) a gene delivery composition for
delivering the GCs to a cell for transfection. Also provided are nucleic
collection sequence (TP) from an intracellular protein that alters a
cellular process when FP enters the cell, and (ii) a transcellular
polypeptide sequence (TP) from an intracellular protein that alters a
cellular process when FP enters the cell, and (ii) a transcellular
polypeptide sequence (TP) that promotes transcytosis of FP. The FP
consists of at least one CDK binding motif and a TP. See X26220 for
detailed uses of the recombinant transfection system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              25-MAY-1999 (first entry)

Patent No. 5919997
GENERAL INFORMATION:
APPLICANT: Beach, David H.
APPLICANT: Serrano, Manuel
APPLICANT: Definho, Ronald A.
TITLE OF INVENTION: Transgenic Animals Having Modified Cell-Cycle
TITLE OF INVENTION: Regulation
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
